Workflow Design & Diagnosis

Foundations (Everyone), Chapter 8/10 — Revision & Viva-Prep Cheatsheet (English + Roman Urdu)
Source: agentfactory.panaversity.org/docs/workflow-design-diagnosis-crash-course

EN: Which steps to hand to AI, what to do when work goes wrong, and how to describe it afterward. Core idea: the unit of value is the STEP, not the session -- and ownership is decided top-down: eligibility, then ownership, then implementation.
Roman Urdu: Kaunse steps AI ko dena, jab kaam galat ho to kya karna, aur baad mein ise kaise describe karna. Core idea: value ka unit STEP hai, session nahi -- ownership top-down decide hoti: eligibility, phir ownership, phir implementation.

1. Design the Work

- Unit of value = a step, not a whole session. Requirements extraction needs 5 settled answers before delegation. Rule: 'compute it, never write it' (use code execution for numbers).

2. The Delegation Map

- 3 layers, in order, never backwards: **Eligibility -> Ownership -> Implementation.** 3 criteria: reversibility, stakes, accountability.
- **3 mapping errors:** over-delegation, halo delegation, unstaffed gate, mapping-the-tool (not the decision).

3. Build It, Watch It

- Ideate -> prototype -> feedback -> refine loop. Escalation signal vs. a 'solved 3 times' signal that means it's time to fix the root cause, not keep patching.

4. When It Misbehaves

- **4 causes by symptom timing:** under-specification, context overload, wrong feature-or-model, stale configuration. Diagnose cheapest-first.

5. Make the Fix Stick + Operate It

- Reaction -> instruction -> lever: turn a rule/reference/procedure into a standing instruction/knowledge/Skill.
- **Incident-hour, 4 decisions:** stop, scope, tell, map-change. 3-audience description pattern -- never drop the gate when explaining to different audiences.

Key Terms Cheatsheet

One line each — English + Roman Urdu.

Term	English	Roman Urdu
Delegation Map (3 layers)	Eligibility -> Ownership -> Implementation, always in that order.	Eligibility -> Ownership -> Implementation, hamesha isi order mein.
Halo delegation	Over-trusting AI on a task because it did well on an adjacent one.	Kisi adjacent task mein achha karne ki wajah se AI ko overtrust karna.
Unstaffed gate	A required human-review step nobody is actually assigned to.	Zaroori human-review step jo kisi ko assign nahi hui.
Compute it, never write it	Numbers should come from code execution, not be typed/guessed.	Numbers code execution se aayein, type/guess nahi hon.
4 causes of misbehaving workflows	Under-specification, context overload, wrong feature-or-model, stale configuration.	Under-specification, context overload, wrong feature-or-model, stale configuration.

Quick Self-Check

Question	Answer
What's the unit of value in this framework?	A step, not a whole session.
Why must the Delegation Map go Eligibility -> Ownership -> Implementation, never backwards?	Deciding who/what can own a step before deciding how to implement it prevents mapping the tool instead of the decision.
What's 'halo delegation'?	Trusting AI on a task because it performed well on a different, adjacent task.
What are the 4 decisions to make in the first hour of an incident?	Stop, scope, tell, map-change.
